Control system4.2 Grid-side converter control5.1 Industrial applicationsRotorPublished in print edition November, 2010This chapter introduces the operation and control of a Doubly-fed Induction Generator (DFIG) system. The DFIG is currently the system of choice for multi-MW wind turbines. The aerodynamic system must be capable of operating over a wide wind speed range in order to achieve optimum aerodynamic efficiency by tracking the optimum tip-speed ratio. Doubly-fed wind turbine generator set structure

generatorIntroductionHistoryExternal linksDoubly fed induction generator (DFIG), a generating principle widely used in wind turbines. It is based on an induction generator with a multiphase wound rotor and a multiphase slip ring assembly with brushes for access to the rotor windings. It is possible to avoid the multiphase slip ring assembly, but there are problems with efficiency, cost and size. A better alternative is a brushless wound-rotor doubly fed el...

The doubly fed induction generator system presented in this article offers many advantages to reduce cost and has the potential to be built economically at power levels above 1.5 MW, e.g., for off-shore ...

Explore the DFIG system: the essential design that enables variable-speed wind turbines to reliably support the electrical grid.

A more modern and more flexible version of the induction generator that is used in large wind turbines is a variant called the doubly-fed induction generator. In a conventional induction generator the ...

Unlike a traditional generator, a DFIG is fed with electrical power on both the rotor and stator sides, allowing for two-way power flow. This is ...

The control system for the double-fed asynchronous generator (used in the wind power setup) enables intuitive operation and real-time visualization throughout the experiments.

Unlike the traditional squirrel-cage rotor, the doubly-fed generator adopts a three-phase symmetrical winding. The rotor windings are embedded in ...

Unlike conventional induction generators, DFIG uses a back-to-back power electronic converter connected to the rotor winding, allowing independent control of the rotor currents. This ...
