---

The issue here is that the `future = m.make_future_dataframe` method creates a dataset future where the only column is the `ds` date column. In order to predict using a model with regressors ...

```
future (const future & ) = delete; ~future (); future & operator =(const future & ) = delete; future & operator =(future & & ) noexcept; shared_future &lt;R&gt;; share () noexcept; // retrieving the value ...
```

`impl&lt;F&gt;` Future for `Box&lt;F&gt;`; where `F: Unpin + Future + ?Sized`, `Boxed` futures only implement the `Future` trait when the future inside the `Box` implements `Unpin`. Since your function ...

The promise is the `&quot;push&quot;`; end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in `std::memory_order`) ...

The `get` member function waits (by calling `wait ()`) until the shared state is ready, then retrieves the value stored in the shared state (if any). Right after calling this function, `valid ()` is false. ...

`wait_until` waits for a result to become available. It blocks until specified `timeout_time` has been reached or the result becomes available, whichever comes first. The return value indicates why ...

However, this is many years in the future, giving affected decorators plenty of time to update their code. Make the future import a no-op in the future: Instead of eventually making from ...

Specifies state of a future as returned by `wait_for` and `wait_until` functions of `std::future` and `std::shared_future`. Constants

The class template `std::future` provides a mechanism to access the result of asynchronous operations: An asynchronous operation (created via `std::async`, `std::packaged_task`, ...
