-----

Specifies state of a future as returned by `wait_for` and `wait_until` functions of `std::future` and `std::shared_future`. Constants

The issue here is that the `future = m.make_future_dataframe` method creates a dataset future where the only column is the `ds` date column. In order to predict using a model with regressors ...

```
future (const future & ) = delete; ~future (); future & operator =(const future & ) = delete; future & operator =(future & & ) noexcept; shared_future &lt;R&gt;; share () noexcept; // retrieving the value ...
```

`wait_until` waits for a result to become available. It blocks until specified `timeout_time` has been reached or the result becomes available, whichever comes first. The return value indicates why ...

The promise is the `"push"` end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in `std::memory_order`) ...

However, this is many years in the future, giving affected decorators plenty of time to update their code. Make the future import a no-op in the future: Instead of eventually making from ...

The class template `std::future` provides a mechanism to access the result of asynchronous operations: An asynchronous operation (created via `std::async`, `std::packaged_task`, ...

The `get` member function waits (by calling `wait ()`) until the shared state is ready, then retrieves the value stored in the shared state (if any). Right after calling this function, `valid ()` is false. ...

`impl&lt;F&gt;`; Future for `Box&lt;F&gt;`; where `F`: `Unpin + Future + ?Sized`, `Boxed` futures only implement the `Future` trait when the future inside the `Box` implements `Unpin`. Since your function ...
