We collect and analyze raw sound data from turbine blades using AI to detect early damage, an industry-first approach for blade health monitoring.

This study proposes a physics-informed neural network framework for damage detection in wind turbine blades in operational wind farms, leveraging active acoustic excitation and a helical ...

Within hours of fiberglass from a broken offshore wind turbine washing ashore on Nantucket, clean energy and anti-wind advocates jumped on ...

This study explores the use of noise emitted during wind turbine operation for the assessment of blade structural integrity.

In this paper, an AE method using airborne sound for damage detection of wind turbine rotor blades was presented. The number of three ...

The audio signal caused by the damage of the blade is mixed with the periodic audio signal generated by the rotation of the wind turbine blade. Therefore, the k

Watch as a wind turbine's blade bends wildly in a brutal storm before breaking apart in jaw-dropping fashion. The chaos unfolds from a bodycam as the camera ...

Wind turbine noise is generated aerodynamically by the rotor blades passing through the air as well as mechanically by various components such as nacelle fans and generators.

Discover the real sounds of wind turbines. Uncover the truth behind the noise and learn what to expect from these renewable energy giants.

The sound of wind turbine blades breaking
