FuseCurrent Sensing/Coulomb CountingThermistorsMain SwitchBalancerBattery cells have given tolerances in their capacity and impedance. So, over cycles, a charge difference can accumulate among cells in series. If a weaker set of cells has less capacity, it will charge faster compared to others in series. The BMS has to therefore stop other cells from charging, or else the weaker cells will get overcharged, as see...See more on allaboutcircuits SynopsysWhat is a Battery Management System (BMS)? - How ...There are many BMS design features, with battery pack protection management and capacity management being two essential features. We'll discuss how these ...

The BMS is the central control for the battery and vehicle interface. It handles a wide range of signals, including cell-level inputs, collision detection, ...
