-----

If you are considering wind farms as a potential investment, take the following factors into account to ensure that you have an ample risk management plan for ...

The risk assessment (GBU) is a central instrument for ensuring occupational safety in the operation of wind turbines. Modern, object-oriented ...

The EHS Guidelines for wind energy include information relevant to environmental, health, and safety aspects of onshore and offshore wind energy ...

The risk management plan used by E.ON for this particular project was analyzed and compared with existing theories on risk management. The results from the study shows that the major risks with ...

Accidents happened in wind power enterprises can lead to severe consequences. Based on the statistical analysis on the collection of the accident of world wind.

Some of the Type 1 WTGs have limited VRT capability and may require a central reactive power compensation system to meet wind power plant VRT capability. Many of the Types 2, 3, and 4 WTGs ...

This document is the manual for the Wind Risk Self-Assessment Tool. The different topics and subtopics are described. For each subtopic the indicators are elaborated and best practice frequencies are if ...

In Germany, the share of electricity generated by wind power and fed into the power supply grid has grown to around 10% (end of 2012) with an installed total capacity in excess of 30,000 MW.

The object of study is a wind energy project, namely a wind farm working as part of the national energy system. The implementation of the project is related to both external and internal risk ...
